

Comparator domains are prescribed, not reconstructed from felt images

a Single-fibre cylindrical unit cell

wall mask: bare node $c=0$; covered node has zero normal flux
 placement rule (not drawn): Poisson sites; $N = \text{round}(n_n A_{surf})$
 assigned volume per site is V_s/N

b Registered central slice of the pore network

Exact slice: $z=7$; 225 nodes; 420 throats; line width maps registered initial radius r_0 .

Solve: g_h scales with r^4/ℓ ; g_t scales with r^2/ℓ ; $\ell = 60 \mu\text{m}$.

Allocation: $V_{s,k} = V_{total} w_k / \text{sum}(w)$; $r_{new,k}^2 = \max(r_{0,k}^2 - V_{s,k} / \pi \ell, r_{min}^2)$.

Tested w_k : uniform; surface area; small throat; current path; collector bias; registered strong-site draw.

Flat definition only: no deposit field, coverage map, blockage front or reconstructed felt morphology is shown.
